

Valinge Click System Quick Tips

Taiga's new click system (Valinge) is currently used for Taiga Sherlock 7.3 mm, Adore 8.3 mm, and Envy 12.3 mm products. The click is very easy and quick to use once you are familiar with the installation method. Please follow the steps outlined below.

- 1) Please note, the panels are not installed by tapping the ends together.
- 2) Row one should be put together by inserting each panel end into the groove of the previous panel at a 45-degree angle to ensure proper locking. All spacers need to be in place around the walls so the product does not slide around while you work on the next rows.
- 3) Row two is started by inserting the long side into row one at a 45-degree angle and letting the piece rest in the neutral position. The neutral position is where the long side of the panel is engaged in the previous row and the panel is slightly elevated from the sub floor. The next panel should be inserted into the end of the first panel at a 45-degree angle and then shifted toward the previous row until the clicks are engaged on the long side as well. Once again, let the row rest in the neutral position until the entire row is completed in the same manner. Once the row is complete you then go back and click the entire row down until it is level.
- 4) Complete all additional rows the same way until your room is complete leaving 3/8" spacing around the perimeter of the room and all fixed objects.
- 5) It is important to follow all installation instructions included in the packaging.
